VARIABLES

CREATE OUR FIRST VARIABLE

Variables in Python are easy to make!

Unlike other languages there is no command for creating a variable.

They are created the moment you assign a value to it.

```
x = 5  
y = "John"  
print(x)  
print(y)
```

Here we have created two variables named x and y

We call creating a variable *declaring* a variable.

EDITING OUR FIRST VARIABLE

Once a variable has been created we can change the contents of it!

```
x = 4  
print(x)  
x = "Sally"  
print(x)
```

EDITING CONTINUED

- We can also set a variable equal to another variable!

```
x = "test"  
y = x  
print(y)
```

- Here the variable y will have the same value as x
